

OOAD MINI PROJECT

Team 13- Live Tracking timeline

Synopsis:

The module is built around a TrackingEvent entity that captures an order ID, a milestone, and a timestamp. We support five milestones via a Milestone enum: ORDER_PLACED, DRIVER_ASSIGNED, ORDER_PICKED_UP, OUT_FOR_DELIVERY, and DELIVERED. Events are stored and retrieved through a TrackingRepository interface, with an in-memory implementation backed by a HashMap. The TrackingService interface exposes two operations: addEvent to record a new milestone, and getTimeline to retrieve all events for an order sorted by timestamp. Querying an unknown order returns an empty list.

Deliverables include the full module implementation, unit tests covering the happy path and edge cases, a class diagram, and a sequence diagram documenting both the addEvent and getTimeline flows.
